

AIR RESERVATION SYSTEM

Cmpe321 - Introduction to Database System

Semester: 3 (Summer Class)

Name: Barın Özmen

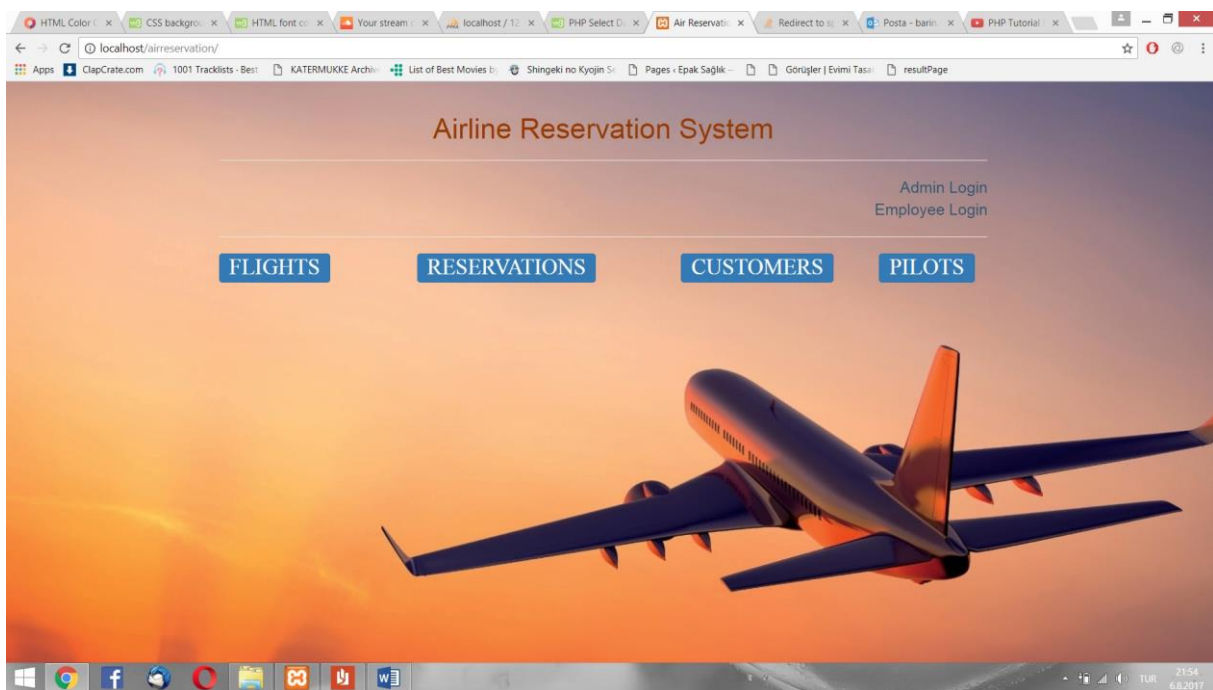

Id: 2012400045

1.Introduction

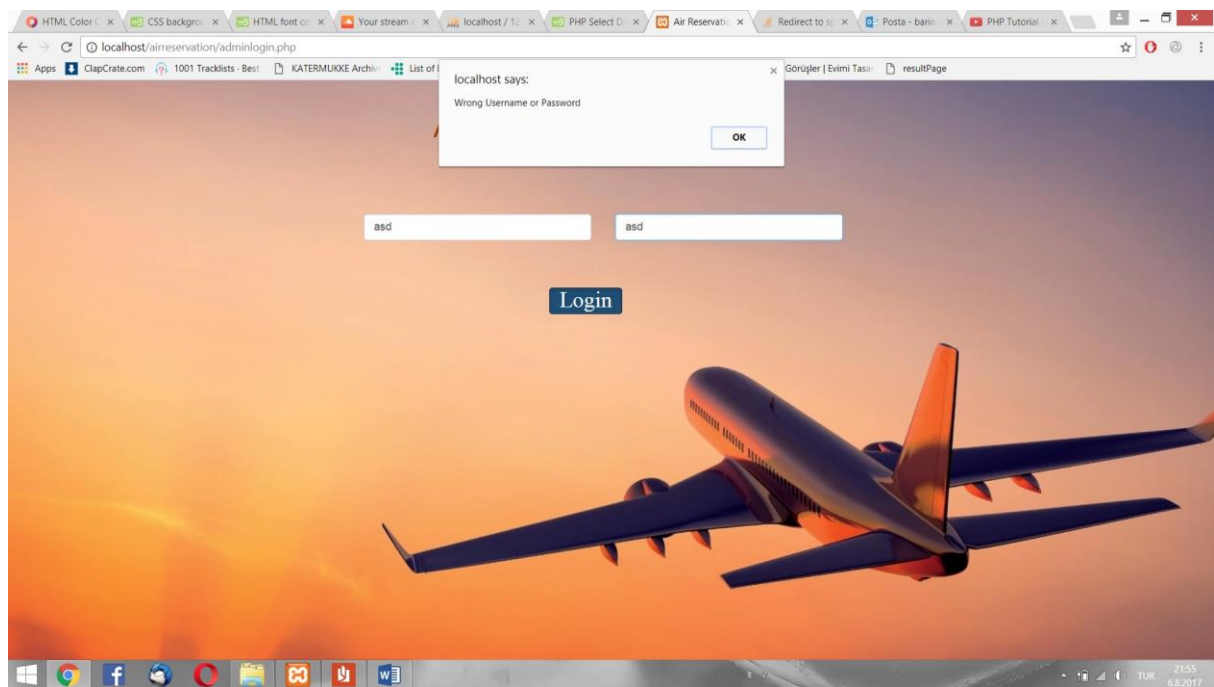

In this project we are supposed to learn php and database to combine both of them to create a web page for air reservation application. Firstly there comes a design for webpage which is implemented in html. After that, through xampp and phpadmin, database creation is completed. Then there is a connection between them through php. There are 2 type of users in this project which are admins and employees. Both have different capabilities. Most of the capabilities owned by admins. In my project there is only 1 admin with username "ozmenbrn" and password "123". Admin can add employees, flights, pilots and also edit them. Employees can only do create reservations.

2. Interface

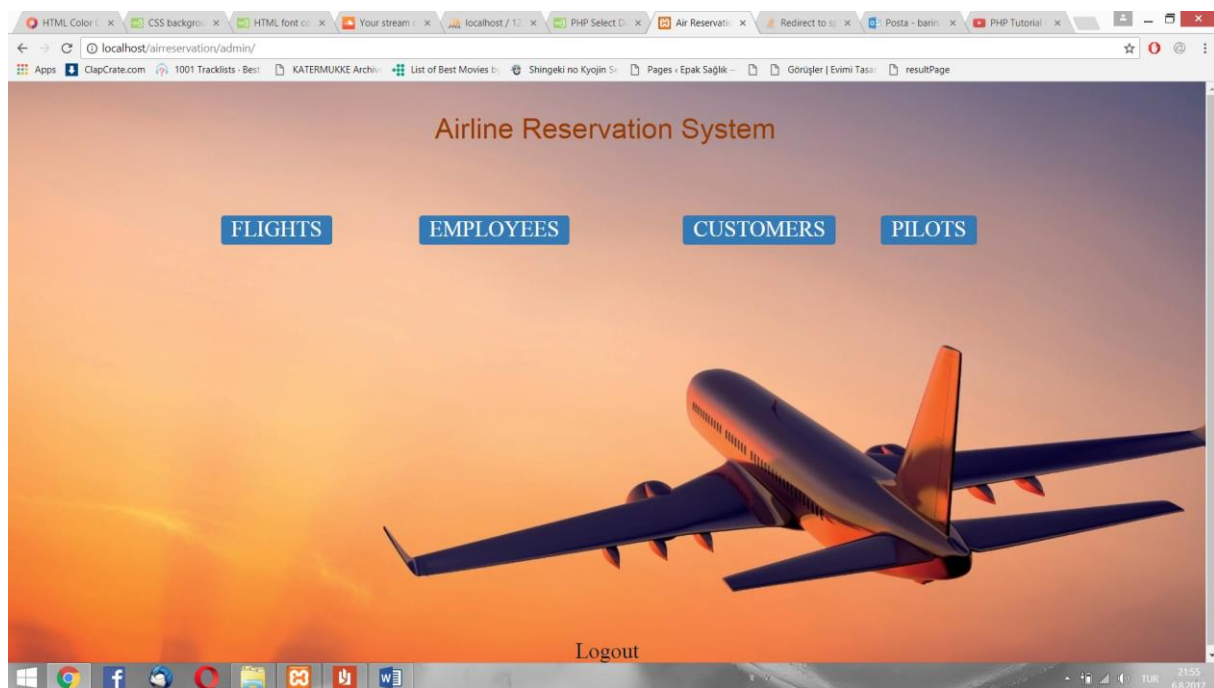

This is the main page of the site. You can login 2 different ways, and 4 different selection

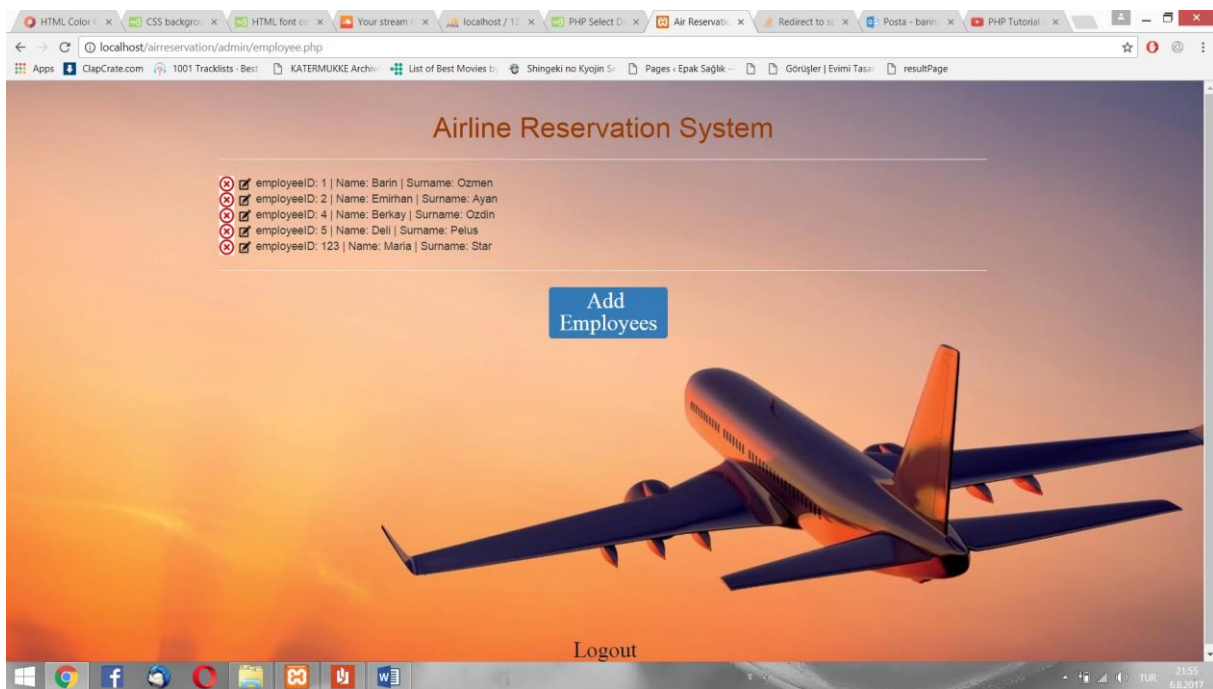

Admin login, Type wrong input and couldn't login

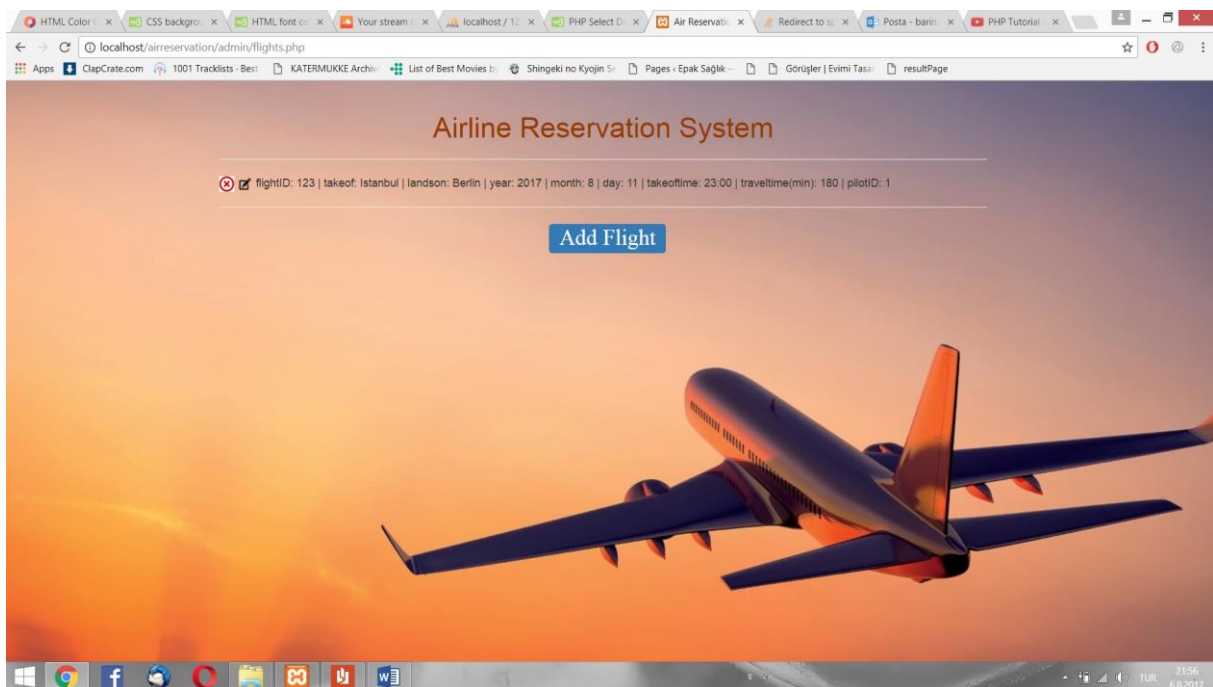

After login, admin can edit 4 of the options.

This is employee page entered by admin, Admin can edit, delete or add employee.

This is same as employee. Again admin can do both of the options.

3. Database

Couldn't done. I spent quite large time on that project but, i couldn't manage time well actually.

4. Conclusion

In this project, i learn how to create a database, make connection with php to sql servers. How to use queries to select or make another execution. This was really nice to create something new. I thought i learned so much. Yet, i couldn't finish all the project. Reservation part is missing due to lack of time that i couldn't manage.
